### **ABSTRACT**

To gather data on the future educational needs for successful employment in Seminole County, Florida, a cooperative study was conducted by Seminole Community College and the Seminole County Public Schools. A sample was developed of 450 employers selected by types of businesses employing technology education graduates in Seminole, Orange, and Volusia counties. A list of questions for future telephone interviews were mailed to the chief executive officers of 285 firms, with interviews conducted with 63% of the sample. Study findings included the following: (1) the most desired non-technical job requirement was work ethic/appearance (48%); (2) with respect to retraining, 78% of respondents expressed a preference for training by in-house staff; (3) for firms indicating a preference for training by outside organizations, 27% indicated a preference for a series of non-credit college level seminars, 23% mentioned vocational programs linked to a public education institution, and 21% indicated a program linked to credit courses; (4) only 18% of respondents had employees hoping to pursue an associate degree; (5) the most commonly cited programs to fulfill training needs were technical education (16%), business/clerical/secretarial (14%), and computer training (12%); (6) with respect to anticipated hires, the dominant occupational needs were blue collar service, clerical/office/computer, and sales; and (7) 80% of health care firms indicated they would be employing more cross-trained personnel. Appendixes include the classifications of employers, the survey instrument, a phone contact summary, and results. (MAB)

### **EXECUTIVE SUMMARY**

In order to understand the future educational needs for the successful employment of Seminole County students, a scientifically selected sample of 285 employers in Seminole, Orange, and Volusia counties were interviewed. These counties represent the traditional source of employment for many residents of Seminole.

The Study was a cooperative effort between Seminole Community College and the Seminole County Public Schools. In addition, it involved the services of a telemarketing firm which provided an efficient, professional interviewing resource resulting in an outstanding response rate of 63%.

National level studies point to the fact that, while there will be a growth in high tech and professional occupations, the vast majority of new jobs in the future will be in lower paying occupations in such areas as retail sales, cashiering, and office/clerical. This type of job growth is a reflection of the restructuring of the U.S. economy from manufacturing to service.

As the restructuring is occurring, the labor force itself is undergoing major demographic changes. It is becoming older and more Hispanic in composition. Many national studies are particularly concerned with growth of workstyle problems. Increasingly, new workers lack basic educational skills and traditional work values.

The results of this study testify to the fact that the Central Florida economy, as represented by the sample of employers interviewed in Seminole, Orange, and Volusia Counties, very closely follows national trends in the areas of work force needs and occupational growth.

1

3

Specifically, the study found that future occupational needs would be in the area of blue collar service, clerical/office/computer and sales. In general, the respondents interviewed found that one of the most pressing work force problems was work ethic/appearance and lack of basic educational skills, i.e. the workstyle problem.

### INTRODUCTION

The National Job Market

A radical restructuring of the U.S. occurred during the 1980's. According to Hecker (1992) the U.S. Department of Labor has seen the major economic trend as the replacement of high paid manufacturing jobs with lower wage service jobs. This movement has had particular impact on male high school graduates.

Waldrop (1994) has indicated that by the year 2005, the occupations that will experience the largest absolute gains in employment will be the lower level jobs of retail sales people, cashiers, general office clerks, and truck drivers. These jobs will be in retail trade, government, finance, insurance, and real estate.

Waldrop (1994) further indicates that the fastest growing occupations (which still will not produce large numbers of new job openings by 2005) are in health care, reflecting an aging U.S. population, and include home health aides, physical therapists, and medical assistants. Other high growth occupations yielding relatively small numbers of new jobs are paralegals, special-education teachers, private detectives, correction officers, child-care workers, and travel agents. Chart A below summarizes the Waldrop data.

### Chart A

### **Industrial-Strength Services**

Virtually all U.S. employment growth will be concentrated in service industries.

(Civilian employment in 2005 and change in employment 1992-2005, in thousands; and annual percent change, 1992-2005, by industrial division for the moderate-growth scenario)

	<u>1992-2005</u>		Annual

Jack Metzgar (1994) of the Midwest Center for Labor Research summarized this changing U.S. occupational structure best when he said recently that, "The middle-range jobs are not there...the way the economy is headed is that some high-wage jobs are increasing, but the proliferation of low-wage jobs is increasing even more quickly" (p.25).

4

### The National Labor Force

As the job market undergoes a radical restructuring, major demographic changes are occurring to the labor force itself. Kleiman (1994) indicates that by 2005, the work force will be older and more Hispanic. Specifically, Hispanics and Asians will increase faster than the population of Blacks and Non-Hispanic Whites. Additionally, the number of workers, ages 45 to 54, will increase three times faster than the labor force as a whole.

Crispell (1990) notes that as the U.S. approaches the new century, the labor force will grow more slowly, dropping from annual growths of 2% to growths in the range of 1.2%. This is a reflection of a higher college-going rate for high school graduates and a slower population growth. The effect of this trend will be a shrinking pool of those available for vocational/on-the job training and an increase in the number of applicants looking for white collar employment.

### Workstyle

While the structure of the job market and the character of the work force will be important factors affecting the nature of work in the next century, an equally important variable is the work attitude, appearance, and general educational preparation of workers. These considerations can be summarized in something called workstyle. Boyd (1992) is one of many authors now describing a growth in workstyle problems in the U.S. work force. He describes a drop in the general skill level of workers. This drop includes a decline in reading, writing, and reasoning abilities. Matching the lowering in skill levels is a loss of traditional work values. The new worker is simply more poorly educated, less concerned with his/her work appearance and more interested in "easy money" than in a commitment to employment and hard work.

### BACKGROUND TO THE STUDY

In the light of national occupational issues, it is important for educational institutions in Central Florida, one of the highest population growth areas in the nation, to plan their educational programming to help their graduates to match the local employment needs.

Specifically, in December of 1993, the Dean of Applied Technologies at Seminole Community College, located in a county suburban to Orlando, and the Director of Applied Technology for the county school district approached the Institutional Research Office at the College about conducting a joint occupational needs assessment. The study could be used by both organizations for program planning. Such a project would have the added benefits of shared resources and the establishment of a common data base that could facilitate future program planning between the school district and the college.

The school district and the college agreed to share the costs, while the Institutional Research area would supply the expertise and coordinate the project. Funding from two institutions made it possible to conduct a more extensive study and to out-service some of the data gathering process. With shrinking research budgets and the increasing availability of more sophisticated technological tools, new approaches to traditional research projects are now possible. Cooperative research efforts, as well as the outservicing of aspects of the work, are growing trends in the field. The present study has the added feature of utilizing these techniques. Their impact as well as the results themselves are reported in the study.

### **METHODOLOGY**

Sampling

Over 85% of graduates from vocational/technical programs of the college and the school district are hired by businesses located in Seminole County or the two adjacent counties of Orange and Volusia. Having the available resources it was decided to survey all three counties.

The first step was to have the Dean of Applied Technologies at the college and the Director of Applied Technology Education for the school district identify from placement data the major types of businesses that hired program graduates. Sixty-two Standard Industrial Classifications (SIC's) were identified. Mail listing companies supplied current data for all of the businesses in these SIC's. Having the companies represented in this format allowed for easy data manipulation for both sample construction and mailing. Appendix A lists each of these SIC's.

The sampling procedure used was a weighted, systematic, multistage, cluster sampling process. The procedure involved three stages.

### STAGE 1

The total number of businesses in the SIC's of interest were identified for each of the three counties (Seminole, Orange, and Volusia). The number to be selected from each county was based on the proportion that each contributed to the total. It was decided that consistent with similar regional studies of this scope, to construct a 10% sampling. The final sample size was 450.

7

### STAGE 2

Within each county sub-sample, the SiC's were then represented in proportion to their representation in each county.

### STAGE 3

Within each SIC in each sub-sample, the proportion of small, medium, and large businesses were constructed to be the same as in each county SIC.

Once the three stage clustering was completed, we had identified the number of small, medium, and large businesses that would be sampled form each SIC in each county. The determination of the actual businesses to be surveyed was accomplished through a systematic sampling of each SIC listing in each county, employing the necessary skip factor to allow us to go through each listing in its entirety, thus minimizing bias.

The final sample composition consisted of 73 businesses in Seminole, 257 in Orange, and 120 in Volusia. Appendix B has the detailed breakout of each company sampled along with the cluster variables.

### Survey Technique

With the cooperation of the college and the school district, a survey instrument was constructed by the Institutional Research Office. The type of information needed required largely open ended questions. A copy of the complete survey can be found in Appendix C. In order to maximize the responses to such an open ended format, it was determined that an interview type structure would be necessary.

Time and staff size would normally prohibit a research office from employing an interview methodology with a sample of 450. However, the out servicing of this portion of the research made this approach feasible. A telemarketing firm, Marketel Inc. was employed. Together with Marketel, the Institutional Research Office designed a mail/telephone interview approach. The CEO in each firm was initially mailed a copy of the survey instrument and told that he/she would be contacted by phone within 4 to 5 days of receipt of the letter. Marketel conducted the phone interviews and recorded the results. Of the 450 samples, there were 275 successful interviews. In addition, 10 of the firms mailed in their responses, rather than participate in a phone interview. This resulted in a total response of 285, creating a response rate of over 63%. Had the Institutional Research Office conducted the survey by itself, the approach would have been a mail only survey. A normal mail survey with two mailings tends to have a response rate of around 30% over a three month period. The very successful response rate of over 63% in about one month is a testimony to the value of the phone interview approach and the skills of a professional telemarketing company. Appendix D contains a Marketel Summary of all phone contact

### Representativeness of Sample

Chart B compares the composition of the firms composing the 62 Standard Industrial Codes (SIC's) within the 3 county area surveyed with the sample of 285 firms interviewed. A return rate of 63% produced what appears to be a fairly representative sample. The sample has slightly less Orange county businesses and slightly more medium sized firms than the original population, but is otherwise strikingly similar.

### Sampling Error

The results represented in this study are subject to sampling error. Sampling error is the difference between the results gathered from analysis of the sample and that which would be obtained by analysis of the entire population. Peter Hart Research Associates Inc.(1989) has developed a technique for estimating possible sampling error. Hart maintains that sampling error will vary in relation to sample size and the percentage of respondents giving a particular answer. The table found in Chart C is modified from one used by Hart to establish the range of error at different sample sizes and percentages of response.

Based on the Hart methodology, our overall sample responses would appear to have an acceptable sampling error of around 5%.

10

### CHART B

	Composition of 3 Counties - Population of Firms	Composition of Firm Sample
		Return Rate of 63%
Number of SIC's Codes	62	42
% Orange Cty Firms	55%	49%
% Seminole Cty Firms	19%	19%
% Volusia Cty Firms	26%	32%
% Small Firms	70%	66%
% Medium Firms	22%	26%
% Large Firms	8%	8%

### PRIOR RECENT SURVEY RESEARCH

Two fairly recent public surveys of the occupational impact of education are worth noting at this point. The first was done by the Dover Group (1991) and was a survey of the public perception of the standards that should be used to examine the value of public education (pre K-12). It was conducted in the thirteen school districts of Dutchess County, New York. Among the most important findings were that parents believed that education should help develop work force skills in the areas of work ethics and basic educational skills. In addition, those interviewed stressed the concept of citizenship which included decision making skills, respect for authority, and understanding society.

The other study is specific to the Central Florida region. In January 1993, Orange County in combination with the City of Orlando, Osceola County, Seminole County, and Lake County contracted with the Wadley Donovan Group Inc. to do an economic development study of the Mid-Florida Region. As part of that study employers in two target areas were interviewed: administrative/support office and high tech/manufacturing. As this is one of the more current studies available, it's worth summarizing the findings regarding employee needs.

In the area of administrative/support office, Wadley Donovan (1993) interviewed firms in banking, insurance, and publishing. Many of them had sizable administrative and headquarter functions. The vast majority of those interviewed cited highly developed social skills as qualities that they were seeking in future employees. These social skills included being able to work in a team environment, possessing strong communication abilities, possessing good grammar, and having good job interview skills.

The other frequent observation made by employers in the administrative/support office area was that clerical skills were becoming more demanding, requiring multi task job responsibilities.

In the high tech/manufacturing area, the employers identified future labor needs only within specialized engineering skills i.e. environmental, metallurgical, software Lan programming, NR machine operation, and laboratory technology.

With reference to Seminole County particularly the Wadley Donovan indicated that

Health care services is a rapidly growing sector, and provides ideal opportunities for Seminole. In particular: third-party health care services cover a wide range of administrative functions(legal, billing, utilization review, etc.) that are suited to Seminole's wide range of resident labor supply skills. (p.11)

Both the survey of citizens and the study of Central Florida employers point to the workstyle problem within the American work force alluded to earlier in the paper. The young person entering the job market often lacks basic educational skills, makes a poor appearance, and is usually more concerned with "easy money" than in a work commitment.

### RESULTS

Appendixes E, F, and G contain the detailed responses to the survey questions. The following highlights refer to the total sample of 285 firms. The trends identified for the sample were largely consistent with the results for each county sub sample.

### Question 1

In your judgement, what are the most important non-technical jobs needed now by your employees?

The dominant response (48%) was work ethic/appearance.

### Question 2

As you retrain your current employees for technological developments, what type of training would be preferable?

78% of the 285 firms indicated that they would prefer their current employees to be trained by in-house staff.

### Question 3

If your training preference in Question 2 is by an outside organization, by which method or methods would you see this training occurring?

27% indicated a series of non-credit college level seminars, 23% indicated vocational programs linked to a public educational institution, and 21% indicated a program linked to college credit courses.

### Question 4

Does your company presently have employees that would like to pursue an associate degree at a community college? If so, in what field?

Only 18% of the respondents indicated that they have employees that would like to pursue an associate degree. This is consistent with the preference expressed in Question 3 for training in the form of non credit workshops. Among the 18%, training in business was the dominant choice.

### Question 5

In your judgment, what vocational/technical training programs should be developed to address your training needs of the future?

16% of the respondents chose technical education (specifics in Appendix F) followed by business/clerical/secretarial at 14% and then computer at 12%.

### Question 6

Could you tell me, by job title, the number of new or replacement positions you anticipate hiring over the next year and the necessary educational background for each?

The dominant occupational needs (job titles) were blue collar service followed by clerical/office/computer and then sales. The area with the largest number of future job openings was sales. The educational training needed for most of these jobs would be a general high school diploma.

### Question 7

Could you tell me, by job title, the number of new or replacement positions you anticipate hiring over the next 3 years and the necessary educational background for each?

The longer term need (3 year) is largely the same as the short term (1 year) with the only change being that clerical/office/computer will surpass blue collar service and

16

result in the educational training needs to include vocational training as well as a high school diploma.

### Question 8

In your judgment, will health care providers, such as hospitals and doctors, be employing more personnel who have been cross-trained?

80% of the 20 firms in the sample who where in the health field said "yes" to cross training.

### Question 9

If your answer was yes to cross-training, in what areas do you anticipate that the cross-training should occur?

Nursing was the predominant response with others detailed in Appendix G.

### Question 10

If your answer was yes to cross-training, could you give us the names of any providers who have specific plans to hire persons who have been cross-trained or who plan to cross-train within their organization?

There was no response to this question.

### **Question 11**

Do you have any additional comments that you would like to make?

The two most often mentioned comments were the need for basic education skills (20%) and better work attitude (17%).

# APPENDIX C SURVEY INSTRUMENT

# OCCUPATIONAL NEEDS ASSESSMENT SURVEY ORLANDO METRO AREA (ORANGE, SEMINOLE, VOLUSIA COUNTIES)

# Conducted by Seminole Community College and the Seminole County Public Schools

1.	In your judgment, what are the most important non-technical job skills (such as reading and math, quality of work, communication, and reasoning skills) needed now by your employees?						
	Skill						
2.	As you retrain your current employees for technological developments, what type of training would be preferable? (Please choose one best answer).						
	a. trained by an outside organization such as a community college, vocational education center, or a private vendor.						
	b. trained by you or your own staff (in house).						
3.	If your training preference in question 2 above is by an outside organization, by which method or methods would you see this training occurring? (respondent may choose more than one answer)						
	a. Through an in-house training program run in cooperation with an educational institution.						
	b. Through a program linked to college credit courses.						
	c. Through a series of noncredit, college-level seminars and workshops of short duration.						
	d. Through a vocational program linked to a public educational institution.						
	e. Through a vocational program linked to a private educational institution.						
	f. Other						
4.	Does your company presently have employees that would like to pursue an associate degree at a community college? If so, in what field?						
	a. yes number field b. no
